

This advertorial was produced for company use in educating prospective customers regarding their unique, customized approach to energy systems for large corporations.

SMARTWATT ENERGY HELPS YOU FIND THE RIGHT SOLUTIONS FOR YOUR WORLD

One of the more difficult energy-related problems companies face is feeling secure that the options they're presented are the best options for their workers and facility. The problem with having manufacturers design your solution is their priority may not be yours as the customer. Many times, manufacturers work to sell you their proprietary products, making it difficult or impossible to upgrade, expand, service, or make improvements to your system as you see fit.

Energy System Optimization companies, on the other hand, can send product agnostic experts to assess your specific needs based on what's best for your organization, your people, and your facility. With their assistance, you can select the best products available to match your needs. Using a service agency such as SmartWatt Energy to help you design or upgrade your system can help you more fully address your needs while getting the best value.

"We've always been committed to the customer first," said Ben Stewart with SmartWatt. "We're different in that we don't let manufacturers dictate which solution is right for the customer."

In addition to making you their first priority, SmartWatt has a long history of developing customized sustainability projects, helping you save money. Our approach provides you with clear information regarding how to maximize improvements or how your choices might affect construction as well as how to maximize your savings while meeting the highest engineering standards. From blueprint to footprint, our innovative project management team works to make the upgrade process easy for you, offering ongoing maintenance, sustainability, branding, and media outreach once your project is complete.

Our staged approach begins with our retro-commissioning projects, which provide an average of 2-6% whole building energy savings by resolving existing problems. This approach accounts for the interactions among all the energy flows in a building and produces a systematic plan for upgrades that increasingly improve energy savings. Each stage includes projects that will affect projects in future stages. Additional stages include HVAC Control projects to manage systems, accounting for up to 40% of a facility's energy usage and Lighting projects, lowering lighting costs by up to 90% by combining state-of-the-art engineering, the latest LED lighting technology, and advanced open protocol zone-based controls technology.

Customized energy solutions mean long-term energy savings and improvements for your business, school, or government organization. Taking this integrated approach to sustainability projects produces a systematic plan for upgrades that increase energy savings. Our multi-disciplinary teams are passionate about delivering quality, savings, and customer satisfaction.

As a result of our dedication, we've won several Inc. magazine Hire Power awards and have been named one of the Fastest Growing Private Companies in the United States on the magazine's annual 5000 list multiple times.
